```
which are designated as PRO polypeptides are described The membrane-bound proteins have various industrial applications, including as pharmaceutical and diagnostic agents. The membrane-bound proteins can also be employed for screening of potential peptide or small molecule inhibitors of the relevant receptor/ligand interaction. Anti-PRO antibodies are useful for the affinity purification of PRO from recombinant cell culture or natural sources
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New human nucleic acids encoding secreted and transmembrane polypeptides, designated as PRO polypeptides, useful as pharmaceutical and diagnostic

The present sequence represents a novel human polypeptide. The proceed fication describes novel polypeptides designated PRO21, PRO292, PRO327, PRO1215, PRO1414, PRO343, PRO345, PRO345, PRO1415, PRO1515, PRO1512, PRO1512, PRO1512, PRO5853 and PROS82. These genes are amplified in the genome of tumour cells. The polypeptides are believed to contribute to tumourigenesis. The polypeptides are useful target for the identification of certain cancers, and may act as predictors of the prognosis of tumour treatment. Antibodies against these polypeptides are useful in the treatment and diagnosis of neoplastic cell growth and proliferation in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              300
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    120

The invention relates to one hundred and twenty two nucleic acids encoding PRO polypeptides. The sequences of the 122 PRO polynucleotides encode human secreted proteins. The PRO nucleic acids, polypeptides, agonists and antagonists are useful for treating a PRO related disorder. The PRO polypeptides are useful for diagnosing tumours, especially lung cancer, colon cancer, breast tumour, prostate tumour, rectal tumour or liver tumour. The PRO polypeptides are useful for stimulating the proliferation of, or gene expression, in perioyte cells, for stimulating the proliferation or differentiation of chondrocyte cells, for stimulating the release of tumour necrosis factor-alpha from human blood, for stimulating the proliferation of normal human dermal fibroblast cells. The PRO polypeptide may also be used as molecular weight markers and for tissue typing. The PRO nucleic acids have applications in molecular biology, including use as hybridisation probes, and in chromosome and gene mapping. AAU83592-AAU83713 represent human PRO protein sequences of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

New isolated PRO polypeptide and encoding nucleic acid, useful for the diagnosis and treatment of disorders associated with the PRO polypeptide, such as AIDS, cancer, atherosclerosis, inflammatory disease and diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to an isolated PRO polypeptide (a secreted or transmembrane protein) comprising: (a) at least 80% sequence identity or positives when compared to any of 15 sequences, fully defined in the specification, lacking or with its associated signal peptide; or (b) at least 80% sequence identity to a sequence encoded by the full-length coding sequence of a DNA deposited in the American Type Culture (collection (ATCC). Also included are: (i) an isolated nucleic acid comprising: (a) at least 80% sequence identity to a nucleotide sequence that encodes a PRO protein, (b) at least 80% sequence identity to a nucleotide sequence or full-length coding sequence with any of 15 fully

defined sequences of 957-3441 base pairs, given in the specification; or (c) at least 80% sequence identity to a full-length coding sequence of a DNA deposited under ATCC Accession No. 209526, 209508, 209508, 209530, 209532, 209532, 209531, 209529, 209577, 209570, 209508, 209531, 209521 or 209510, 209531, 209529, 209577, 209570, 209518, 209531, 209521 or 209619; (2) a vector comprising the nucleic acid; (3) a host cell comprising the vector which, when cultured under conditions suitable for expression of the PRO polypeptide, produces the PRO protein; (4) a chimeric molecule comprising PRO fused to a heterologous amino acid commerce, and (5) an anti-PRO antibody. The methods and compositions of the present invention are useful for the diagnosis and treatment of the present invention are useful for the diagnosis and treatment of disease, diabetic complications, cardiac injury and organ failure. The antibodies can also be used in the different screening, therapeutic and biological assays. The present sequence represents a PRO protein
                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 540
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              120

                                                                                                                                                                                                                              ð
                                                                                                                                                                                                                                                                                                                                                           The present invention relates to the isolation of novel human PRO polypeptides, and the polynucleotide sequences encoding them. The PRO polypeptides are secreted and transmembrane proteins. The PRO polypeptides and polynucleotides are useful for preparing a medicament useful in the diagnosis and treatment of tumours. Anti-PRO antibodies are useful in diagnostic assays for PRO, by detecting its expression in specific cells, tissues or serum, and for affinity purification of PRO from recombinant cell culture or natural sources. ABUS0739-ABUB0860 represent the human PRO polypeptides of the invention. Note: The sequence data for this patent was obtained in electronic format directly from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     240

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention describes an isolated nucleic acid molecule comprising a sequence with at least 80% identity to: (a) a nucleotide encoding any of 122 PRO (secreted and transmembrane) polypeptides whose sequences are fully defined in the specification; or (b) any of 122 nucleotide sequences having e.g. 4834, 250% or 1759 bp fully defined in the specification; or (b) any of 122 nucleotide sequences. The PRO POLYPEPTIGES or polynucleotides are useful as pharmaceuticals, diagnostics, biosensors or bioreactors. These are particularly useful for detecting tumours (e.g. lung tumour, colon tumour, prostate tumour, rectal tumour, or liver tumour) in a mammal, for stimulating the release of TNF-alpha from human blood, for stimulating the proliferation or differentiation of chondrocyte
                                                                                                                                                                                                                                                                                                                                                             598
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; secreted and transmembrane protein; PRO; cytostatic; antiarthritic; osteopathic; gene therapy; TNF-Agonist-Alpha; chondrocyte stimulator; fibroblast modulator; pharmaceutical; diagnostic; biosensor; bioreactor; tumour; lung tumour; oolon tumour; breast tumour; prostate tumour; rectal tumour; liver tumour; bone disorder; cartilage disorder; sports injury;

cells, for stimulating proliferation of pericyte cells, or for modulating normal human dermal fibroblast proliferation. The PRO nucleic acid or polypeptide is also useful for treating tumnours or various bone and/or cartilage disorders (e.g. sports injuries or arthritis), or wounds. The PRO polypeptides are useful in drug screening, particularly as targets for therapeutic intervention in these diseases, and in the diagnostic determination of the presence of these diseases. The PRO polypeptides are also useful as molecular weight markers, or for chromosome identification. The PRO genes are useful as hybridisation probes, or for screening libraries of human cDMA, genomic DNA or mRNA. The PRO genes may also be used in gene therapy, particularly for replacing a defective gene. This is the amino acid sequence of a novel human secreted and transmembrane PRO polypeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           360

The PRO polypeptide or polymucleotide is useful in pharmaceuticals, diagnostics, biosensors or bioreactors. These are particularly useful for detecting or treating cancers, inflammatory diseases, atherosclerosis, cardiac injury,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New secreted and transmembrane polypeptides (e.g. PRO241, for use pharmaceuticals, diagnostics or bioreactors, particularly for deteror treating e.g. cancers, infertility or acquired immunodeficiency syndrome in mammals.
birth defect, premature aging; diabetes; dog; cat; horse; acquired immunodeficiency syndrome; cow; sheep; pig; goat; rabbit; industry; cytostatic; antiinflammatory; cardiant; antiinfertility; anti-arteriosclerotic; antidabetic.

chromosome New transmembrane polypeptides and polynucleotides useful for chromo identification, tissue typing, gene therapy, in chromosome and gene mapping, or as molecular weight markers. N-PSDB; ABX96821.

Claim 12; Fig 26; 172pp; English.

The invention relates to an isolated nucleic acid encoding a secreted/transmembrane polypeptide (designated as PRO proteins). 15 PRO polypeptides and their encoding polynucleotides are disclosed. Also included are a vector comprising the PRO nucleic acid, a host cell comprising the best cell under conditions for the expression of the PRO polypeptide, and recovering the PRO polypeptide from the cell culture, an isolated polypeptide having at least 80% amino acid sequence identity to the PRO polypeptides, a chimaeric molecule comprising PRO fused to a heterologous amino acid sequence and an antibody which specifically binds to PRO. The PRO nucleotide sequences are useful as hybridisation probes, in chromosome and gene mapping, in generating sense and antisense RNA or DNA, in generating transgenic or knock-out animals which can be used in the development and screening of therapeutically useful reagents, and in gene therapy. The polypeptides may be used as molecular weight markers for protein electrophoreeis purposes. The PRO polypeptides and nucleic acids may also be used for chromosome identification, and tissue typing. US2002150976-A1.

New isolated PRO polypeptide and encoding nucleic acids, useful for the diagnosis and treatment of disorders such as inflammatory disease, atherosclerosis, cardiac injury, infertility, AIDS, cancer and diabetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention describes a novel isolated PRO polypeptide. The methods a compositions of the present invention are useful for the diagnosis and treatment of disorders such as inflammatory disease, organ failure, atherosclerosis, cardiac injury, infertility, birth defects, premature aging, AIDS, cancer, diabetic complications and mutations in general. This is the amino acid sequence of a novel human secreted PRO protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gurney AL;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This invention relates to a nucleotide sequence encoding an isolated secreted and/or transmembrane protein. The nucleotide sequences of the invention may have antiinflammatory, antiarteriosclerotic, cardiant, anti-infertility, anti-HTV, cytostatic and antidiabetic activities and may be used in gene therapy. The nucleic acids and polypeptides are useful for treating inflammatory diseases, organ failure, atherosclerosis, cardiac injury, infertility, birth defects, premature aging, AIDS, cancer, or diabetic complications. The nucleic acids are useful as hybridisation probes, in chromosome and gene mapping, and in generating antisense RNA or DNA. The polypeptides are useful as pharmaceuticals, diagnostics, biosensors or bioreactors. Both are useful in tissue typing. The present sequence represents a protein encoded by the nucleic acids of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            300

The invention relates to an isolated PRO polypeptide having at least 80% amino acid sequence identity to and scoring at least 80% positives when compared to any of 15 fully defined sequences of 235-954 amino acids, given in the specification. Also included are: (1) an isolated PRO compared to any of 15 fully defined mucleic acid sequence identity to a nucleotide sequence that encodes PRO or its extracellular domain, and comprising any of 15 fully defined nucleotide sequences of 957-3441 bp, given in the specification and deposited under ATCC accession number of your in the specification and deposited under ATCC accession number comprising the PRO nucleic acid; (3) a host cell comprising the vector; (4) producing PRO polypeptides, comprising the vector; (4) producing PRO polypeptides, comprising the PRO polypeptide and recovering the PRO polypeptide and comprising acid sequence; and (6) an anti-PRP antibody. The methods and compositions are useful for the diagnosis and treatment of disorders such as inflammatory disease, organ failure, atherosoclerosis, cardiac injury, infertility, birth defects, premature aging, AIDS (acquired immunodeficiency syndrome), cancer, diabetic complications and mutations in general. The present sequence is a a PRO polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New isolated PRO polypeptide and encoding nucleic acids, useful for the diagnosis and treatment of disorders such as inflammatory disease, atherosclerosis, cardiac injury, infertility, AIDS, cancer and diabetic

The invention describes an isolated secreted and transmembrane polypeptide, designated as PRO polypeptide (1) having at least 80 % cannot be a sign, 379, 984, 737, 433, 422, 300, 243, 455, 694, 440, 598, C26, 281, 431 or 235 amino acid sequence (31), given in the specification, S1 lacking its associated signal peptide or extracellular command of S1 withour without its associated signal peptide. (1) and the command of S1 without its associated signal peptide. (1) and the polymucleotide (II) encoding it are useful in tissue typing and gene thorwapy. (II) is also useful for generating transgenic animals or thorwapy and second animals for the development and screening of therapoutically cuseful reagents. PRO233 polypeptide is useful for treating inflammatory disease, organ failure, atherosclerosis, cardiac injury, infertility, cuseful reagents. PRO233 polypeptide is useful for treating inflammatory disease, organ failure, atherosclerosis, cardiac injury, infertility, control of processing processing and processing processing and processing proc
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                301 APTWLSPTAPATEAPSPPSTAPPTVGPVPQPQDCPPSTCLNGGTCHLGTRHHLACLCPEG 360

```

useful for the affinity purification of PRO from recombinant cell culture or natural sources. The protein sequences and antibodies against them are useful for preparing a medicament treatment of a condition which is responsive to these. The present sequence represents a novel human protein sequence of the invention

Novel secreted and transmembrane polypeptides useful in tissue typing and preparing medicament for treating condition which is responsive to the

Claim 1; Fig 26; 172pp; English

This invention relates to the cDNA and protein sequences of a novel human secreted and transmembrane proceins such as RRO241, PRO343, PRO299, PRO313, PRO313, PRO314, PRO344, PRO344, PRO344, PRO355, PRO355, PRO353, PRO354, PRO354, PRO354, PRO355, PRO355, PRO357, PRO355, PRO353, PRO357, PRO354, PRO355, PRO355, PRO355, PRO357, PRO355, PRO3555, PRO3555, PRO3555, PRO3555, PRO3

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 69,
